🔹 1. Project Overview

Project Overview

This project analyzes an e-commerce dataset of 10,000 orders to explore sales performance, revenue distribution, and customer behavior.
The analysis was conducted using Microsoft Excel with pivot tables, charts, KPIs, and interactive slicers.

🔹 2. Dataset Information

Dataset Information

- Source: Kaggle (public dataset, used for educational purposes)
- Records: 10,000 orders
- Time period: 2024
- Currency: Converted from EGP to EUR for consistency

🔹 3. Objectives

Analysis Objectives

- Identify key revenue-driving product categories
- Analyze sales performance by platform and location
- Examine monthly revenue trends
- Explore relationships between sales volume, ratings, and reviews

---

🔹 4. Methodology

Methodology

- Data cleaning and validation (missing values, data consistency checks)
- Feature creation (monthly breakdown, average order value)
- Pivot-based aggregations and KPI calculations
- Interactive dashboard design using slicers

🔹 5. Key Insights

Key Insights

- Electronics and Fashion account for over 60% of total revenue.
- Revenue is evenly distributed across platforms, indicating low channel risk.

- Monthly revenue remains stable throughout the year with no strong seasonality.
- Higher review volume does not necessarily correlate with higher average ratings.
- Brand sales volumes are relatively balanced, with no dominant brand.

🔹 6. Deliverables

Deliverables

- Interactive Excel dashboard with dynamic KPIs
- Revenue and performance analysis by category, platform, brand, and city
- Business-focused insights to support decision-making
